Use mathematical reasoning to investigate and solve problems involving doubling numbers into the millions.

Example:

A wise man told an Emperor that he would like some rice. He asked the Emperor if he could have a grain of rice for the first square of a chessboard, then two grains of rice for the second square, then four grains of rice on the third square and to keep doubling for each square of the chessboard.

How much rice is on the 9th square?

How much is on the tenth square?

How many grains of rice does the wise man get?

Week 29

Understand Pythagoras' theorem about the lengths of sides in a right-angled triangle and test the rule.

Example:

Pythagoras' theorem states that for any right-angled triangle, the square of the length of the longest side, c , is equal to the sum of the squares of the two shorter sides, a and b . ($a^2 + b^2 = c^2$).

Draw a right-angled triangle and measure the lengths of the three sides. Then draw and cut out three squares, one of each length, to show that the area of the largest square equals the total area of the smaller two squares.
